Irving College – Inter-disciplinary Studies in Ecology, Architecture and Living, of Living Economics

By Shomit Sirohi

I. A Sketch of the Urban City – From the Countryside to the City in Different Arrows – Riding in a Taxi and coming forth

In fact I sketch the developments of agriculture in the rural communities of Uttar Pradesh and enter the city and developments of building, the speed of the car taxi and see the Mayur Vihar ecological depth and housing which then enters through that sleepiness the main city which then is a set of circles intersecting into my own house in Graeco-Roman organic living as black people understand that this is the highest life being led in the world for them, not for the objective development of mainstream advanced capitalism.

II. Inter-disciplinary Approaches to Ecology and Economics, Living Economics

In fact one film records just the lighting and housing standards as real estate and monopoly rent which then becomes a living city, the economics of mixed type then succeeds at its planning, and in fact the rest is a cinema shooting activity, or even an urban living walk to the hills – finally frescoes of American Idealism reveals that it is afterall exchange dynamics which are one set of mediations – the rest is living economics, as Lefebvre and Cornel West meet Sirohi and other philosophers laugh and join – this is the highest economics gets okay.
